Publication involvement of plastic surgery residents in accredited services: A 10-year comparative analysis

Publicação dos residentes de cirurgia plástica em serviços credenciados - análise comparativa de 10 anos

FABIANO CALIXTO FORTES DE ARRUDA 1,2*
PAULO RENATO SIMMONS DE PAULA 1,2

Introduction: Conducting research and publishing articles during residency are not mandatory yet. However, these are shown to be necessary during training. This study aimed to evaluate the participation of resident physicians from services accredited by the Brazilian Society of Plastic Surgery in the publication of articles in the Brazilian Journal of Plastic Surgery by analyzing how they have evolved over a period of 10 years.

Methods: We evaluated articles published in the Brazilian Journal of Plastic Surgery between 2003 and 2012, excluding editorial, letter, message, erratum and acknowledgment articles. We also evaluated data regarding sex, demographic region, type of work, number of papers published with the participation of residents, mean number of residents per publication, subject area, and educational institution.

Results: We identified 204 articles, of which 53 were published between 2003 and 2007, and 151 were published between 2008 and 2012. The most common subject was body contour, accounting for 95.1% of descriptive studies. Most of the authors were not affiliated with higher institutions (54.4%), and the residents from the southeast region were most active participants. On comparing different periods, we observed an increase in the number of residents as authors and in the participation of residents. The number of articles increased significantly in all regions of the country, except in the south.

Conclusion: The participation of residents in the publication of scientific articles that were published in the last 5 years in the southeast, northeast, and midwest regions has increased. The training structure for resident physicians should be improved to increase scientific publication in both, quantitative and qualitative aspects.

ABSTRACT

Introduction: Conducting research and publishing articles during residency are not mandatory yet. However, these are shown to be necessary during training. This study aimed to evaluate the participation of resident physicians from services accredited by the Brazilian Society of Plastic Surgery in the publication of articles in the Brazilian Journal of Plastic Surgery by analyzing how they have evolved over a period of 10 years.

Methods: We evaluated articles published in the Brazilian Journal of Plastic Surgery between 2003 and 2012, excluding editorial, letter, message, erratum and acknowledgment articles. We also evaluated data regarding sex, demographic region, type of work, number of papers published with the participation of residents, mean number of residents per publication, subject area, and educational institution.

Results: We identified 204 articles, of which 53 were published between 2003 and 2007, and 151 were published between 2008 and 2012. The most common subject was body contour, accounting for 95.1% of descriptive studies. Most of the authors were not affiliated with higher institutions (54.4%), and the residents from the southeast region were most active participants. On comparing different periods, we observed an increase in the number of residents as authors and in the participation of residents. The number of articles increased significantly in all regions of the country, except in the south.

Conclusion: The participation of residents in the publication of scientific articles that were published in the last 5 years in the southeast, northeast, and midwest regions has increased. The training structure for resident physicians should be improved to increase scientific publication in both, quantitative and qualitative aspects.

INTRODUCTION

Brazilian services of medical residency are validated by the Ministry of Education and Brazilian Society of Plastic Surgery (BSPS). During medical training in plastic surgery, physicians are provided the opportunities to acquire clinical and surgical knowledge from the initial history of the patient to postoperative follow-up, to study and gain qualification in different surgical techniques, to develop skills in detecting patients who are candidates for surgery, to gain efficaciousness in case of emergency care and plastic surgery emergency, and to develop research activities. 

Performing research and publishing articles during the period of medical residency has not been made mandatory till date. However, in many countries, this has been shown to be necessary during the evolution of the plastic surgeon for the improvement and evolution of evidence-based medicine.

OBJECTIVE

To perform multivariate statistical evaluation regarding the participation of medical residents from services recognized by the BSPS in the publication of articles in the Brazilian Journal of Plastic Surgery by assessing their evolution over a period of 10 years.

METHODS

We selected articles published in the Brazilian Journal of Plastic Surgery from 2003 to 2012, excluding editorial, letter, message, debates, errata, and acknowledgment articles. The study included articles from plastic surgery services that are currently accredited by the BSPS and involved the participation of residents, interns, and aspirant members in plastic surgery.

We evaluated data such as sex, demographic region of accredited services, type of work, number of papers published with the participation of residents, mean number of residents per publication, subject area of the article, and...
accredited service of the education institution. These data were then compared by evaluating two different periods, namely from 2003 to 2007 and from 2008 to 2012.

**RESULTS**

We identified 204 articles, of which 53 (26.0%) were published in the first period (2003-2007) and 151 (74%) were published in the second period (2008-2012). Of these, 194 (95.1%) were descriptive, 5 (2.5%) were analytical, and 5 (2.5%) were experimental studies. The most common topics addressed in plastic surgery were body contour (42/20, 6%), the face (35/17, 2%), tumors (14/6, 9%), flaps and microsurgeries (13/6, 4%), hand, rhinoplasties, post-bariatric management, wounds and dressings, burns, body contour, experimental (111/33, 7%) plastic surgery, and others (31/15, 2%).

The authors were affiliated with several institutions that were categorized as institutions of higher education (n = 93 articles, 45.6%) and non-teaching institutions (n = 111 articles, 54.4%). Of the total number of articles (n = 204), 138 (67.6%) were related to the type of reconstructive surgery; 50 (24.5%), to aesthetic procedures; and 16 (7.8%), to others.

The number of articles published increased proportionally in all of the regions, except the south, where the increase was not significant (Figure 2). The participation of residents in the publication of articles and the number of articles increased significantly (p ≤ 0.001). In the evaluation of the entire study period, no difference was observed in the participation of different institutions over the period of 10 years. The number of articles from higher education institutions was 93 (45.6%), and that of articles from non-teaching institutions was 111 (54.4%; χ² = 1.588, p = 0.208; Table 3).

Regarding the participation of the residents per article, 88 articles (43.1%) involved the participation of only one resident, of whom 61 (69.3%) were men; 58 articles (28.4%), the participation of 2 residents, of whom 56 (96.4%) were men; 30 articles (14.7%), the participation of 3 residents, of whom 30 (85.5%) were men; and 28 articles (13.7%), the participation of 4 or more residents, all of whom were men. The mean number of resident participations per article was 2.11 ± 1.47. The number of resident authors increased from 4 (6.8%) in the first period evaluated to 55 (93.2%) in the second period evaluated (p ≤ 0.001; Figure 1).

CO: Midwest, N: Northeast, SE: Southeast, S: South. *The number of publications in the region in the period evaluated/the number of services in the region in the period evaluated.

The fact that the male sex was more prevalent than the female sex among the residents demonstrates that changes regarding gender equalization in the course of medicine have not been extended yet to the surgical specialty. Medical residency services are concentrated in the southeast region. This explains why the highest number of works was published by residents from this region.

The increased participation of residents, as authors or coauthors, was observed in all of the regions. We also observed an increase in the number of works published by residents from the northeast, midwest, and southeast regions. However, no such increase was observed in the southern region during the period evaluated. The increase in the number of published works was significant, although far from the existing potential. If we consider that each resident should publish one study per year, approximately 262 articles would be published per year, taking into account 3 residents per the 84 services currently existing. For the survey in this study, only 151 articles were published in the last 5 years. Considering the potential for 5 years, 1,310 articles should have been published, suggesting that only 12% of the estimated potential was achieved.
When comparing the residency program with North American standards\textsuperscript{3,5,8-10}, which require residents to engage in the production and development of scientific methods in their first years, we found that the Brazilian medical residency still lacks structure in this area. This can also be visualized when looking at the number of papers presented at conferences and published. This confirms the existence of a gap that needs to be filled, thus allowing these works to be published in a journal. Among the obstacles that may be encountered, we can describe the following: the lack of interest in publications; the lack of technical skill in the preparation of an article; the lack of obligation for publication or complete the final course project to obtain the title of Specialist; the external commitments that, in addition to residency, occupy most of the time; the costs; and the time to complete a study and to document it.

As limitations of this study, the survey only reflected the Brazilian Journal of Plastic Surgery, as we did not address studies published by residents in other journals.

**CONCLUSION**

An increase in the participation of residents in the production of scientific articles published in the last 5 years was observed in the southeast, northeast, and midwest regions.

Changes in the structure of resident physician training are required to improve scientific production in both quantitative and qualitative aspects.
